Task 1 for IIUM KOE Python Lab

Task No (Marks)	Task Description	Input/Appended Code		
WEEK 1 – INTRODUCTION TO PYTHON (WRITE EACH TASK IN SEPARATE PYTHON FILES)				
Task 1a. (3m)	Create a program that asks the user to provide a number N. Then, the user needs to provide another N numerical inputs to be stored in an array. The program then needs to output the following. - The total value - The average value - The maximum value - The minimum value - The range	INPUT 1 5 2 5 1 9 2	INPUT 2 7 1.3 5 2 1.5 9.8 0.4 6	INPUT 3 9 −2.3 10.9 6 0 −4 2.6 1.2 −3.7 −1.9
Task 1c. (2m)	Create a program that calculates the length of hypotenuse of a right-angled triangle. The other 2 lengths are taken as float inputs from the user. Consider the input types taken from the user.	INPUT 1 3 4	INPUT 2 1.2 0.5	INPUT 3 5 5
Task 1e. (3m)	Create a program that asks the user for a string and 3 letters. Then, it needs to output the number of each provided letter in the provided string. (Program is not case-sensitive, meaning 'a' and 'A' are the same)	INPUT 1 International Islamic University Malaysia I U M INPUT 2 Kulliyyah of Engineering K O E INPUT 3 Let's Lead the Way, Enlighten the Future L E T		
TOTAL MARKS = 8 MARKS				

Task 2 for IIUM KOE Python Lab

<table>
<tr><th>Task No (Marks)</th><th>Task Description</th><th>Appended Code</th></tr>
<tr><td colspan="3">WEEK 2 – LINKED LIST
(WRITE ALL TASK IN ONE PYTHON FILE)</td></tr>
<tr><td>Task 2a. (2m)</td><td>Create a linked list that contains addToStart(), displayList() and count() as its internal functions.</td><td rowspan="4">list = LL()
list.addToStart(10)
list.addToStart(20)
list.addToStart(45)
list.addToStart(35)
list.addToStart(15)
list.displayList()
print(list.count())
print(list.countOdd())
print(list.countEven())

list.addToStart(30)
list.addToStart(40)
list.displayList()
print(list.count())
print(list.countOdd())
print(list.countEven())

list.swap(1,5)
list.displayList()
list.swap(2,3)
list.displayList()
list.swap(7,4)
list.displayList()

list.max()
list.min()
list.range()
list.total()
list.average()</td></tr>
<tr><td>Task 2b. (3m)</td><td>Implement 2 internal functions – countOdd() and countEven() – that counts the even and odd numbers in the list.</td></tr>
<tr><td>Task 2c. (3m)</td><td>Implement an internal function – swap() – that swaps 2 elements in the list using their index number. You may print out an error if necessary.</td></tr>
<tr><td>Task 2d. (3m)</td><td>Implement several internal functions – max(), min(), range(), total(), average() – that calculates the maximum number and the minimum number from the list as well as the range of the numbers respectively.</td></tr>
<tr><td colspan="3">TOTAL MARKS = 11 MARKS</td></tr>
</table>

Task 3 for IIUM KOE Python Lab

Task No (Marks)	Task Description	Appended Code
WEEK 3 – STACK AND QUEUE (WRITE ALL TASKS IN ONE PYTHON FILE)		

Task 3a. (2m)	Create a linked list that contains push(), pop(), enqueue(), dequeue(), displayList() and count() as its internal functions.	`listA = LL()`
		`listA.push('P')`
		`listA.push('Y')`
		`listA.enqueue('T')`
		`listA.enqueue('H')`
		`listA.push('O')`
		`listA.enqueue('N')`
		`listA.displayList()`
		`print(listA.count())`
		
		`listA.pop()`
		`listA.dequeue()`
		`listA.pop()`
		`listA.displayList()`
		`print(listA.count())`

Task 3b. (3m)	Implement an external function that converts the linked list into an array. The original linked list will be cleared, and the array will be returned. The function needs the linked list as its parameter and returns an array.
	
	You MUST call stack or queue functions as well as the count function from the created linked list itself into the external functions.
		`listA = LL()`
		`listA.push('I')`
		`listA.enqueue('L')`
		`listA.enqueue('O')`
		`listA.enqueue('V')`
		`listA.enqueue('E')`
		`listA.push('C')`
		`listA.push('O')`
		`listA.push('D')`
		`listA.push('I')`
		`listA.push('N')`
		`listA.push('G')`
		`listA.displayList()`
		
		`arrayA = convertToArray(listA)`
		`listA.displayList()`
		`print(arrayA)`

Task 3c. (3m)	Implement an external function that reverses a linked list into another empty linked list. The original linked list will be cleared. The function needs 2 linked lists as its parameter and have no return value.
	
	You MUST call stack or queue functions from the linked list itself into the external function.
		`listA = LL()`
		`listB = LL()`
		`listA.push('I')`
		`listA.enqueue('A')`
		`listA.enqueue('M')`
		`listA.push('A')`
		`listA.enqueue('M')`
		`listA.enqueue('U')`
		`listA.enqueue('S')`
		`listA.enqueue('L')`
		`listA.enqueue('I')`
		`listA.enqueue('M')`
		`listA.displayList()`
		
		`reverseList(listA,listB)`
		`listA.displayList()`
		`listB.displayList()`

TOTAL MARKS = 8 MARKS		

Task 4 for IIUM KOE Python Lab

<table>
<tr><th>Task No (Marks)</th><th>Task Description</th><th>Appended Code</th></tr>
<tr><td colspan="3">WEEK 4 – HASH TABLES AND DICTIONARIES
(WRITE ALL TASKS IN ONE PYTHON FILE)</td></tr>
<tr><td>Task 4a.
(3m)</td><td>Create a Hash Table of size 5 that has the following features.
- It can hash only string keys. It does so by taking the first letter (all of them are lowercase can change it to a number according to the alphabetical order (a is 1, b is 2 and so on). You don’t have to worry about numerical keys.
- It uses linear rehashing whenever collision happens.
- It must contain __setitem__ and __getitem__ functions</td><td rowspan="2"><pre>hash = HT()
hash['name'] = 'Zikri'
hash['age'] = 20
hash['gender'] = 'M'

print(hash['name'])
print(hash['age'])
print(hash['gender'])
print(hash.keys)
print(hash.values)

hash['birthdate'] = '4
December'
print(hash.keys)
print(hash.values)
print(hash['birthdate'])

hash['name'] = 'Hakim'
print(hash['name'])

hash.delete('age')
print(hash.keys)
print(hash.values)
print(hash['age'])
print(hash['birthdate'])</pre></td></tr>
<tr><td>Task 4b.
(2m)</td><td>Implement an internal function delete() that deletes a value inside the hash table using its key as the parameter.</td></tr>
<tr><td colspan="3">TOTAL MARKS = 5 MARKS</td></tr>
</table>

Task 5 for IIUM KOE Python Lab

<table>
<tr><th>Task No (Marks)</th><th>Task Description</th><th>Appended Code</th></tr>
<tr><td colspan="3">WEEK 5 – BINARY TREE AND TRAVERSALS
(WRITE TASK A IN ONE PYTHON FILE WHILE TASK B AND C IN ANOTHER PYTHON FILE)</td></tr>
<tr><td>Task 5a.
(2m)</td><td>Create a binary tree as well as 3 external functions – printPreorder(), printInorder() and printPostorder() – that display the binary tree in their respective order traversals.</td><td><pre>root = Node(2)
root.left = Node(3)
root.right = Node(7)
root.left.left = Node(1)
root.right.left = Node(6)
root.left.right = Node(4)
root.left.right.left = Node(5)
root.right.right = Node(8)

printPreorder(root)
print()
printInorder(root)
print()
printPostorder(root)</pre></td></tr>
<tr><td>Task 5b.
(2m)</td><td>Create a function – insertSort() – that utilizes the binary tree structure to autosort strings being added into the binary tree. Implement also the 3 external functions from 5a.</td><td rowspan="2"><pre>root = Node('Haziman Sairin')
insertSort(root,'Zikri Hakim')
insertSort(root,'Jameel Majdi')
insertSort(root,'Raniya Waleed')
insertSort(root,'Syukri Talib')
insertSort(root,'Izzat Syahmi')
insertSort(root,'Saif al-Din')
insertSort(root,'Nuqman Aliff')
insertSort(root,'Amir Su\'ad')
insertSort(root,'Abdul Karim')
insertSort(root,'Kamarul Danial')
insertSort(root,'Dania Izzah')
insertSort(root,'Fariz Yazid)
insertSort(root,'Zharif Aiman')
insertSort(root,'Sharifa Harun')
insertSort(root,'Fuad Najma')
insertSort(root,'Muhd Fakhrul')

printPreorder(root)
print()
printInorder(root)
print()
printPostorder(root)
print()
root.deepestBranch()</pre></td></tr>
<tr><td>Task 5c.
(4m)</td><td>Implement a internal function – deepestBranch() – that finds the deepest branch in the binary tree from 5b. If there are several of them, take only the first one. Display depth of the branch as well as the path taken to get to the branch.
Hint 1:
Use ‘Left’ or anything equivalent for left branch and ‘Right’ or anything equivalent for right branch.
Hint 2:
You may need either some global variables or some function parameters to helps you keep track of the path and/or the depth.
Please tell me in the comments at the end of your code which variable did you make global or parameter.

Use the following values for easier initializations.
<pre>deepestPath = “”
depth = 1</pre></td></tr>
<tr><td colspan="3">TOTAL MARKS = 8 MARKS</td></tr>
</table>
